 GI: identification of a common nicotinic acetylcholine receptor
alpha(1)-subunit binding surface for small ligands and alpha-
conotoxins.",
                                                                                                                                                                                                                                                                                                                                                                        -I. FUNCTION: Alpha-conotoxins act on postsynaptic membranes, they bind to the nicotinic acetylcholine receptors (nAChR) and thus inhibit them. The higher affinity site for alpha-conotoxin GI is the alpha/delta site on mouse muscle-deriverd BG3H-1 receptor, and the other site (alpha/gamma site) on nicotinic receptors from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         -1- SUBCELLULAR LOCATION: Secreted.

-!- FUNCTION: Abar-conotoxins act on postsynaptic membranes, they
bind to the nicotinic acetylcholine receptors (nAchR) and thus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MEDINE-84032400; Pubmed-6630187; Gruz L.J., Olivera B.M.; Gray W.R., Rivier J.E., Galyean R., Cruz L.J., Olivera B.M.; "Conotoxin MI. peptide fragments of the polypeptide. 103P2D6 is not expressed in normal adult tissue but is aberrantly expressed in some foetal tissues and many cancers including tumours of the prostate, testis, bladder, bone, cervix, ovary, breast, pancreas, colon and lung. The 103P2D6 polynucleotide, its related protein and also peptide fragments of the protein are therefore
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                useful for diagnosing and treating cancer. A vector comprising a polynucleotide which encodes a single chain monoclonal antibody, that immunospecifically binds to an 103P2D6-related protein, and a ribozyme capable of cleaving a polynucleotide having the 103P2D6 coding sequence, are both useful in the preparation of a composition for treating a patient with a cancer that expresses 103P2D6. The sequences can be used in diagnostic methods to monitor the level of 103P2D6 gene products in serum, blood, urine and tissue and to thereby detect the presence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         tumour; cancer; bone; ovary; breast; pancreas; colon; lung; cytostatic; gene therapy; antibody therapy; ribozyme; serum; blood; urine; bladder; single chain monoclonal antibody; cervix; human.

Sequences AAU23815-AAU24515 represent the 103P2D6-related protein and adult tissue but is aberrantly expressed in some foetal tissues and many cancers including tumours of the prostate, testis, bladder, bone, cervix, ovary, breast, pancreas, colon and lung. The 103P2D6 polynucleotide, its related protein and also peptide fragments of the protein are therefore useful for diagnosing and treating cancer. A vector comprising a polynucleotide which encodes a single chain monoclonal antibody, that munospecifically binds to an 109P2D6-related protein, and a ribozyme capable of cleaving a polynucleotide having the 103P2D6 coding sequence, are both useful in the preparation of a composition for treating a patient with a cancer that expresses 103P2D6. The sequences can be used in diagnostic methods to monitor the level of 103P2D6 gene products in carry.
                                                                                                                                                                                                        tumour; cancer; bone; ovary; breast; pancreas; colon; lung; cytostatic; gene therapy; antibody therapy; ribozyme; serum; blood; urine; bladder; single chain monoclonal antibody; cervix; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polynucleotide for treating and diagnosing prostate cancer is the 103P2D6 gene which encodes for 103P2D6-related proteins -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              peptide fragments of the polypeptide. 103P206 is not expressed in normal adult tissue but is aberrantly expressed in some foetal tissues and many concers including tumours of the prostate, testis, bladder, bone, cervix, ovary, breast, pancreas, colon and lung. The 103P206 polynucleotide, its related protein and also peptide fragments of the protein are therefore useful for diagnosing and treating cancer. A vector comprising a polynucleotide which encodes a single chain monoclonal antibody, that immunospecifically binds to an 103P206 related protein, and a ribozyme capable of cleaving a polynucleotide having the 103P206 coding sequence, are both useful in the preparation of a composition for treating a polynucleotide having the 103P206 coding sequence, are both useful in the preparation of a composition for treating a patient with a cancer that expresses 103P206. The sequences can be used in diagnostic methods to monitor the level of 103P206 gene products in serum, blood, unine and tissue and to thereby detect the presence of

The present invention describes a peptide (I) comprising an isolated surface exposed group/epitope (EI) of C-epsilon-2 domain (D) of immunopibulin E (19b). Or its milmotope. Also described are: (1) an immunopen (II) for treating allergy comprising (I): (2) a vaccine (III) for treating allergy comprising (I): (3) a ligand (IV) capable of the paramaceutical composition (PC) comprising (IV): (5) a peptide (Ia) capable of being recognised by (IV): (6) an immunogen (II) comprising (Ia): and (7) producing (III) by producing (II): (1) com have antiallergic and immunospepressive activities, and can be used as a vaccine and histamine release inhibitor. (I), (II) and (III) are useful in medicine and in the manufacture of medicaments for treating can deventing allergies. (IV) is useful for identifying minotopes of PI, cin medicine and also in manufacturing medicaments for treating allergies. (I) is useful in diagnostics and in the affinity purification confirmating anti-igE antibodies from blood. (I), (III) and PC are consequing anti-igE antibodies from blood. (I), (III) and PC are consequing anti-igE antibodies from blood. (I), (III) and present consequences which are used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0; Gaps

                                                                                                                                                                                                                                                                                                                            The present invention relates to linkage methodology for use in the conjugation of compounds (e.g. peptides) to carrier vehicles (e.g. macromolecules, polymers, denofrimers, proteins) to produce biological and immunological constructs. The invention provides a method for linking an epitope (e.g. a peptide) to a carrier (e.g. a protein) for use in a pharmaceutical composition or a vaccine. The invention describes peptides derived from or a minotopes of the Cepsilon2, Cepsilon3 or Cepsilon4 regions of human immunoglobulin E (IGB) which are used to produce conjugated compounds. The compounds or
                                                                                                                                                                                                                                                                       A linkage comprising an immunogenic conjugate useful treatment of IgE
                                                                                                                                                                                                                                                                                                                                                                                                                                compositions of the invention are useful in the manufacture of a medicament for the treatment of 1gm mediated diseases. The invention allows for controlled conjugation of a peptide epitope (antigen) to a protein so as to form an immunogenic conjugate which may be able to raise a protective antibody response in an animal or human patient. AAU16632-AAU16913 represent peptides derived from or mimotopes of the Cepsilon2/Cepsilon3/Cepsilon4 region of human 1gE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Immunogen; human; IgE; immunoglobulin E; allergy; thio-ether linkage;

The present invention relates to conjugates suitable for use in vaccines, where the conjugate comprises a disulphide bridge cyclised peptide and an immunogenic carrier. The vaccines can be used in the treatment of allergies. The present sequence is a cyclic peptide immunogen derived from human immunoglobulin E (IgE) suitable for use in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   affinity chromatography; electric chromatography; gel filtration chromatography; ion exchange chromatography; partition chromatography; fatty acid primary amide; sleep-inducing;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Purified cis-9,10-octadecenoamidase internal amino acid fragment.
                                                                                                                                                                                                                                                                                                                                                                                           Conjugate for use in vaccine for treatment of allergy, comprises disulfide bridge cyclized peptide and immunogenic carrier -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Purified cis-9,10-octadeceno:amidase - useful for hydrolysing sleep-inducing fatty acid primary amide(s), and identifying inhibitors

                                                                                                                                                                                                                                                                                                                                             ŏ
                      obtained by a chromatographic methodology selected from affinity, electric, gel filtration, ion exchange and partition chromatography. Phe Coase is characterised by enzymic activity for catalysing the conversion of cis-9,10-octadecenoamide (CO) to oleic acid and by the inclusion of an amino acid sequence fragment from rat liver Coase. The present sequence represents a specifically claimed example of such an amino acid fragment is found at residues 31 to 45 of rat liver Coase as shown in AAMIO465. The Coase can be used to catalyse the hydrolysis of fatty acid primary amides, which have sleep-inducing activity. The Coase can also be used to identify inhibitors of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             characterised by inclusion of an amino acid sequence selected from a group of 28 sequences (see AAM5784-811). These FAAHS can hydrolyse cis-9,10 octadecemonate, anandamide (arachidoyl ethanclamine), and myristic, palmitto or stearic amides. Also new are: (1) inhibiting hydrolysis of fatty acid primary amides catalysed by FAAH by FAAH inhibitor; (2) a method of screening for an CF3CO(CH2)7-CH-CH(cis)-(CH2)7Mel; and (4) nucleic acid encoding FAAH amides, particularly those in which the alkyl group has a cis unsaturation. These amides induce sleep, so FAAH can be used to study processes in which they are involved and also to develop

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Alpha conotoxin; inhibit; neuromuscular; synapse; signal transmission.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                              The peptides of the invention are potent inhibitors of synaptic transmission at the neuromuscular junction while lacking inhibition of either nervo c muscle action potential propagation. Their action is freely reversible on dilution or removal of the peptides from the affected muscle. The peptides are useful for reversible immobilisation of a muscle or gp. of muscles in man and other vertebrates and they can be used for detection and measurement of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          peptides all belong to a group of peptides known as the A-lineage conotoxin peptides. The A lineage conotoxin peptides have a wide variety of pharmacological uses. The A-lineage conotoxin peptides claimed (AAR75264-R75293) are useful for the inhibition of synaptic transmission at neuromuscular junctions by blocking nicotinic accept choline receptors and they also have activity against voltage-gated Na

Identifying nucleic acid encoding A-lineage conotoxin peptide(s) by amplification - uses primers corresponding to conserved regions in the signal sequence and 3'-un:translated regions, useful e.g. in treatment of small cell lung cancer

Disclosure; Column 3; 36pp; English.

AAW12726-W12769 represent conotoxin peptides. This sequence represents the GTA alpha-conotoxin peptide isolated from Conus geographus. These sequences are identified using the method of the invention. The method of the invention. The method of the invention is for identified to amplification with primer of the invention is for identified to amplification with primer sequences (see AAT59714 and AAT59715). The primers are specific for the signal sequence and 3'-untranslated (3'UTR) regions of the conotoxin of the onotoxin and the sites for detection. A-lineage conotoxins include alpha-conotoxins, and kappa-conotoxins. Alpha-conotoxins are powerful inhibitors of synaptic transmission at the neuronuscular junction, and are usually nicotinic acceptionline receptor blockers. Rappa-conotoxins are usually nicotinic acceptionline receptors blockers. Rappa-conotoxins are usually nicotinic acceptionline receptors blockers. The conotoxins identified can be used as muscle relaxants, in the diagnosis of mysathenia gravis, and for the treatment or diagnosis of small cell ung cancer. For the treatment of small cell lung cancer, the conotoxin contrinic continic/continic acceptors, and thereby blocking contininic continiis cancer in the nicotinic receptors, and thereby blocking continiis continiis cancer in the conotoxin continiis cancer in continiis cancer in continiis cancer in continiis cancer in continiis cancer continiis cancer continiis cancer continiis co 5-hydroxytryptamine.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
